

DATA PROFILING ASSESSMENTS

THE GO-TO FIRM FOR:

Windows Migrations

Virtual Desktop

Infrastructure (VDI)

Cloud Strategy & Design

Data Center Services

IT Staffing

IDENTIFY YOUR IDEAL SOLUTION FOR MANAGING DATA GROWTH

Often, it is difficult to determine how to address the astronomical growth rates of corporate data. Frequently, extensive research about data types, growth rates, application statistics and backup reporting is required to address these challenges. How can you compile all of this data without putting in long hours and utilizing expensive resources?

DATA PROFILING ASSESSMENT PORTFOLIO

Data Profiling Assessments provide intelligent data analysis and are designed to be a non-disruptive, time-efficient, and cost-effective way to assess the current state and performance of file systems and Microsoft Exchange environments. New enhancements to the tool also provide an opportunity to extract valuable reporting from your existing backup environment. The Data Deduplication Assessment is also a great way to understand the potential of deduplication for your data, while identifying redundant data stored across servers.

FILE SYSTEM ASSESSMENTS (FSA)

File System Assessments examine the metadata of your file environments. The tool helps articulate the value of archiving and helps discover important information about your data (for example, the types of files and the amounts of data you have, the average age of data to enable an archive strategy, etc.). FSAs are an excellent starting point for any backup and archive strategy discussion.

EXCHANGE SYSTEM ASSESSMENT (ESA)

As with FSAs, ESAs provide valuable insight into the Microsoft Exchange environments. ESAs are useful in determining how much e-mail (by user) is being managed and can help determine policies for archival of email. ESAs are also helpful in projecting growth and point out key management aspects of the Microsoft Exchange environment, including PST files and attachment data.

BACKUP SYSTEM ASSESSMENT

The Backup System Assessment is a collection of scripts designed to extract data from your backup server and provides advanced reporting and statistics about the performance of your backup environment. Scripts can run on a multitude of backup systems, including EMC, Symantec, HP, CommVault, and IPM. The assessment results

provide insight into how backups are performing, the amount of data being backed up, backup target statistics and many more important data points.

NEXT STEPS

Request your Data Profiling Assessment from your IPM representative directly, email EMC@ipm.com or call 800-476-1155. All you need is a Microsoft Windows server, 10 GB of space, and a little time, and you will be on your way to a professional assessment of your corporate data – complete with a report and presentation of your findings.
